X
1-24-28 _____ (See 2-8-27 Negreas Garden near Aqua Vista) Valley way at Buena Vista Common. Spec. pressed. Fr. Lilac desc 2-8-27 except: height 1½ to 7 in long & usually ½ in wide. Corolla is fallen & mostly no seed set. Calyx in some cases has tube ¾-1 in long with lobes ¼ in long but mostly Calyx tube shorter to less than ¼ in. Fr. dry capsule, oblong to ⅞ in long. 2 celled. Seeds 1-2 (in one case) on curved processes, flat, the margin seeds enough mucilagenous so that "threads" adhere to dissecting needles.

Prob belongs to Acanthaceae. Capsule suggests & but indentified with Ruellia
Le M. & D. 607. A dried corolla (at first thought
to be withered in bud, but since ovary & stamens
seem normal, perhaps fully developed)
tubular 5 mm long, brownish, with 4 well
marked lobes, less than 1 mm deep.
Stamens 4, filaments shorter than
attached above middle of tube. Anther sacs
unequal lengthwise & connectives & deliscence
lengthwise not at all like Justicia
secunda. Mr. Swanson of St. Georges
says this is "Strobelanthes anisophyllus"
"Lace fan Bell"
& Prob. means S. isophyllus. T. Anders
fo 357 & BM & C.P. 708.

× Justicia secunda. Connectin &
anthers thus: lower lobe smaller &
the whole oblique to filament.

2-13-29 Hibiscus mutabilis, L.
(See 2-26-27 n. Ridley Middle R. & So. R. - - - for Malvaceae) 2-13-29 spec is evidently the same differing only as follows. Lvs from 3 in to 4 3/4 in broad, always somewhat shorter. The radiating veins, esp. the 5 central ones, very distinct above as well as below. Lf 3-5-lobed, with shallow sinuses, irreg. crenate. Petiole sometimes but not always meets blade at L. Stamy petaloid tube marked, & the longer interspersed hairs are yellow. Inflor paniculate, the lower branches in axils of lvs (now fallen). Pedicels 2-3 in. Capsule almost spherical 7/8 in high by a trifle wider. Remains at base of (a) 1 bract of involucre ? & (b) gamosepalous calyx. Seed 3 1/2 mm long. Funicle remains attached to seed & can be separated from it. Each cell 7-12 seeded with remains of non-maturing ovules.

Capsules loculicidally & deliscent at the same time falling away from a short central axis (about 1/3 height of capsule) so that they remain attached only at base & often fall. 2-15-29 from same plant as 3-26-27 Fr. Calyx 1 1/4 + in deep cut into 5 rotate lobes 1+ in deep. 3 or 5 veined. Bracts of involucre 1/2 + in long, linear. No more than 3 seen in any case (Is it possible shrub labled n called Changeable Rose at St. George Public Gardens is this ?)

[x] 3-1-29 Miss Hutchings says this is "Changeable Rose" hence doubtless it is Hibiscus mutabilis L. p 238

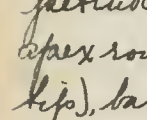
2-18-29 Dichondra carolinensis, Michx p 304 Agri. Stat. in lawn. Lvs beneath & sepals beneath brown scaly fg.

2-18-29 X

Agri Stat. on trellis so east cor of Offices.
Fl. Luxuriant vine: Pro B. Bignoniaceae
Lf. opp. 2 parted sometimes with simple.
Pedicel bet. Each lft obovate on
petiole 3/16 in. Lft 2 1/2 x 1 1/2 in entire
apex rounded (with very short obtuse
tip), base narrowed, glabrous, shining
Petioles 3/4 in. Fls terminal on stout
ing pedicel bet bracts:



Pedicel to 3/4 in. Calyx
3/8 in, tubular narrowed
at top (urn shaped?) with
5 shallow teeth (perhaps 3 more definite
than others so that part of rim looks
merely erose) sometimes a split a little
way down bet two of the teeth. Calyx
wall firm & thick. Corolla rose
purple with inside of tube white except
in front where it is striped white &
self color. Tube 1/4 in, less than 1/8 in
at base, soon curving and en-

larging to 5/8 in. Limb 2 1/4 in across
with 5 almost equal lobes about 3/4 in
deep x 7/8 in wide. Stamens included
4 fertile with 1 short staminode
inserted where tube widens it
Filaments pubescent at very base.
begins to enlarge. N.C. fragrant?

Pistil 1 3/8 in overall, seated in
angular purple
disk, stigma two bladed, tinged
Ovary linear, purplish, at
base like base of style merely. Perhaps
1 celled but can't be sure (20x & 38x)
Ovules many. More likely 2 celled with
ovules on partition wall.
Lvs. (20x & 38x) show white scaley effect
& ovary seems to have same white
resinous deposit on outside & the
style to show some scales.
3-21-29 This plant labeled "Clytostoma
callistegioides. South America" but
note that calyx is truncate with
no "long linear points" see B.M. 7C. P
687 Fl seem jointed (at base of calyx)
to pedicel, pedicel jointed to peduncle
& peduncle to stem. (see next page)

2-18-29 × "Ipomoea Horsfalliae" (labeled) Agri. Stat. in arbor leading southward from from offices. Prof Convolvulaceae & perhaps Ipomoea Horsfalliae, Hook p 302 v BM. 7 C.P. 613. Vine. Glabrous. twiners. Lf more a less circular in outline digitately compound of 5 lfts. Lfts 3 3/4 × 1 1/2 in to mid. lft 5 1/4 × 2 in. oblong to obovate acuminate at apex narrowed to a sessile base. Entire but undulate, veins pinnate, few, anastomosing. Fls thus articulated at a, b & b' with evidences of bases of bracts. Pedicels thickened toward top. Sepals 5 bronze green, each very convex & bladdered with a winged edge extending flatly onto corolla Calyx 1/2 in or less deep. Corolla tubular regular 3 in high. with 5 ovate lanceolate lobes 3/8 in deep. Bright rose red. Stamens 5 equal length & attached at base of tube. filament ~~hairy~~ with densely hairy ring at base. Stamens long enough for anthers to reach to base of corolla lobes. Style one (stigma not on specimen) ovary seated in disk 2 celled with 2 ovules basally attached in each cell. Ovules twice as long as broad & thick & per B papillose margin

× 3-21-29 plant labeled Clytostoma callistegioides. Outside of corolla glutinous in bud (sticks to fingers as studied) aestivation imbricate Ovary seems 1-celled with parietal placentae One bud opened showed stigma of 4 blades 1 staminode, 3 normal staimens, 1 stamen with 1 1/2 pollen cells, 2 stamens (evidently 1 filiment splitting just above base) with 1 1/2 pollen cells

2-18-29 "Callistemon lanceolatus" D.C. (as per label) Agri. Stat. Remains of dehisced fr. Fr. on naked part of twig which bears lvs. for 2½ in. Tip of twig with long scattered hairs on lf-bearing part. Lvs. pubescent or veins below. Lvs. dotted, aromatic. Top of fr. gone (as this circumcisal) showing 3 cells each containing many irreg. seeds. but this cup part is left not by a tool falling but by unequal dehiscence.

2-18-29

Tree east of Bull Pen at Agri Stat. Fr. Twigs warty & at tip many pubescent. Lvs alt. on petioles 3/16-1/4 in. Lf. ovate to 2¾ x 1⅜ in, thin, glabrous & shining. Obtuse or acute at apex, rounded at base. Irreg. low toothed & undulate. Fr. on pedicels ¼ in, singly or in clusters (two) at ends of short slender twigs about ¼ in long. Fr spherical, ¾ in. turning purplish brown. Remains of calyx at stem end & 5 lobed stigma at apex. Fr. cut across shows seeds lying so as to make a cross thus ⊕ tho' no wall divisions of cells is evident. Seeds about 8 in each fr. ovate or wedge shaped ¼ in x ⅛ in and very thin. See 4-10-29 Par-la-Ville and 4-14-29 this tree again Agri. Stat.

~~Dec~~

2-18-29 "Argyreia speciosa", Sweet (labelled) Agri St. vine on trellis just back of Pines. Nos. 6. Unripe fr. shows well developed cotyledons in seed. Whether more than one seed not evident. Sepals 5 unequal to ⅝ x ½ in. ovate. No sign of bracts. B. F. of B. 303. Not in B.M. or C. Outer covering of fr. exudes a sticky sap when cut across.

2-18-29 "Brunfelsia americana" L (labeled) Aggi Stat. Fl. & fr. Corolla tube, & calyx glandular pubescent outside. Filaments fleshy & wrinkled. 1 spec of fr showed a 3rd small cell & valve.

(3-21-29 Calyx lobes & B. grandiflora, not as bright colored as throat of apex 3-14-29 at Aggi. Station)

2-18-29 "Beaumontia grandiflora" Wall (labeled) Aggi Stat Fl. p 295. BM & C.P. No sign. "If-like dehiscing backs" subtending fls. Ovary a hairy cushion, polygonal in cross section, seeming 2 celled (but not as implied 2 distinct ovaries)

3-14-29 Fl. Curio shop Reid St. east of Tower entrance. Calyx lobes reddish & yellowish with tiny glands at base inside. Like glands on calyx of Oleander.

2-18-29 Ixora coccinea L. (labeled) Aggi Stat. Fl. p 869 & BM & C.P. 711. All fls (one spec) have 4 petals & 4 stamens & calyx lobes. Corolla lobe ½ in reflexed & twisted, oblanceolate, with abruptly pointed tip. Tube 1¼ in.

2-18-29 Sapota achras, Mill p 285. BM & C.P. 584 Fr fallen to ground but evidently not ripe as seeds not black all over & taste of fl. Fl. is very puberulent. Fl. bds exude milk when cut. Cells 10 but only 1 or 2 seeds developed.

2-18-29 Jatropha multifida, L p 211 Aggi. Stat. Fr unripe, upright, broader at apex than at base. Not measured but perhaps 1¼ in high by about as broad. Seeds 2 in separate cells but evidence of a third cell with undeveloped ovule.

2-18-29 "Ceratonia siliqua", L (labeled) p 173 & BM & CP 436. Aggi. Stat. No flr or fr. Same as 2 tried in Par-la-Ville which became of color & texture of two gives a general effect like holly.

L.f. pinnately compound. Rachis 6 in. l. to 9 not opp on short petioles ½ in. l. leas, 2¼ in. x 1½ in., oval, obtuse or slightly emarginate at apex, narrowed somewhat to base or at least more narrowed below middle than above. Matrons, shining dark green above & light green below. Entire but undulate. Rachis brown & closely pubescent

#175 R.B.K.

2-21-29 Cerastium viscosum, L p129
This petals are slightly longer than
sepals (even 1 mm longer in some cases)
and capsule is slightly curved upward
this seems surely C. viscosum because
flo are glomerate not loosely cymose,
and pedicels are shorter than sepals,
being 3-4 mm while sepals are
5-6 mm. Lvs. obovate or oval 5/8 × 3/8 in

blunt at apex. Whole plant with
diff. aspect than C. vulgatum as
observed at Bt. H. where pedicels are
definitely elongated. Phil. specimens
of 1927 Bermuda were C. viscosum
8-7-29 Longlands #174 Bt. H.
